Received 20 October 2009; accepted 21 October 2009

 Key indicators: single-crystal X-ray study; $T = 98$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.057; wR factor = 0.137; data-to-parameter ratio = 16.7.

The title compound, $\text{C}_{16}\text{H}_{20}\text{N}_4\text{O}_3\text{S}$, adopts an L-shaped conformation, as seen by the dihedral angle of 76.93 (7) $^\circ$ formed between the two aromatic rings. The most notable feature of the crystal packing is the formation of $\text{N}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds that lead to supramolecular chains orientated along the b axis.

N*-(4,6-Dimethylpyrimidin-2-yl)-4-(oxolan-2-ylamino)benzenesulfonamide*Hadi D. Arman, Trupta Kaulgud, Edward R. T. Tiekink and David J. Young****S1. Comment**

The co-crystallization of active pharmaceutical ingredients is an active area of contemporary crystal engineering (Shan & Zaworotko, 2008). Sulfonamide drugs, *e.g.* sulfadimidine and sulfameter, attract significant interest in this regard, especially owing to their propensity to form polymorphs (Caira, 2007). They are also receiving renewed attention as selective inhibitors of carbonic anhydrase isoforms (*e.g.* Nishimori *et al.*, 2009). As a continuation of studies into the phenomenon of co-crystallization (Broker & Tiekink, 2008; Broker *et al.*, 2008), the co-crystallization of *N'*-(4,6-dimethyl-2-pyrimidinyl)sulfanilamide (sulfadimidine) and 1,4-C₆H₄I₂ in THF was investigated. Colourless crystals of the title compound (I) were obtained unexpectedly; we are not aware of any precedence for this reaction. The insertion of nitrenes into the α C—H bond of cyclic ethers is known (Fructos *et al.*, 2006) and it is suggested that adventitious I₂ in 1,4-C₆H₄I₂ reacts with the aryl amine to give a nitrene stabilized by the *para*-sulfonamide group (Kemnitz *et al.*, 1998).

The molecule of (I), Fig. 1, is bent at the S atom, N3—S1—C7 = 107.85 (10)°, and adopts an overall 'L'-conformation; the dihedral angle between the two six-membered rings is 76.93 (7)°. The five membered ring adopts an envelope configuration at the C16 atom. The crystal packing is dominated by N—H⋯O and N—H⋯N hydrogen bonding interactions, Table 1, that co-operate to form a supramolecular chain along the *b* axis, Fig. 2.

S2. Experimental

Colourless crystals of (I) were isolated from the attempted co-crystallization of *N'*-(4,6-dimethyl-2-pyrimidinyl)-sulfanilamide and 1,4-di-iodobenzene in THF.

S3. Refinement

Carbon-bound H-atoms were placed in calculated positions (C—H 0.95–1.00 Å) and were included in the refinement in the riding model approximation with $U_{\text{iso}}(\text{H})$ set to 1.2–1.5 $U_{\text{eq}}(\text{C})$. The nitrogen-bound H-atoms were located in a difference Fourier map and were refined with a N—H 0.880±0.001 Å restraint, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$.

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
